D03 I CCTV clock assessment

FICTIONAL TRAINING MATERIAL — All people, organizations, records and events are invented. Not a real case or official record.

Prepared 16 October 2026 by fictional technician Nila Sasmita. Devices: loading-bay camera CAM-2 and gate camera CAM-1. This report describes an invented export; no video file is included in the pack.

CAM-2 frame label 21:12:07 shows a person in a dark rain jacket near a white van. The face is obscured. The image description does not identify Raka or establish carton contents. Two rectangular objects appear near the rear doors, but their labels cannot be read.

The clock check found CAM-2 running 64 minutes ahead of the reference clock on 16 October. A configuration log records the same +64-minute offset being applied at 17:00 on 14 October, with no later change in the supplied log. If that offset remained stable, displayed 21:12 corresponds to approximately 20:08 WIB. This is a clock conversion, not proof of who appears in the frame.

The export is incomplete. There is no continuous sequence between displayed 21:20 and 21:35. Whether this reflects recording loss or an export omission is unresolved. No movement during the gap can be inferred merely from the missing frames.

CAM-1 has not been supplied for comparison. Original recorder media, independent clock checks and a complete export should be requested before treating the converted time as conclusive. This fictional technical note does not certify forensic authenticity.
